

Ciantis — Activity System Reference

Core Concept

The Activity tab is the app's complete system history log.

Every action inside Ciantis is recorded, timestamped, searchable, and optionally reversible.

The goal is to make the app feel:

- transparent
- intelligent
- safe
- organized
- undo-friendly
- trustworthy

This is not just a simple history screen. It is a full activity intelligence system.

What Gets Logged

The Activity system should record ALL major actions throughout the app.

Examples:

- created journal entry
- edited journal entry
- deleted journal entry
- created appointment
- deleted appointment
- rescheduled appointment
- changed theme
- changed wallpaper
- changed settings
- activated Protect Mode
- extended Protect Mode
- activated Sleep Mode
- ended Sleep Mode
- uploaded document
- scanned document
- categorized document
- moved dashboard widgets
- completed habit

- skipped habit
- changed AI personality settings
- changed notification settings
- muted notifications
- changed routines
- changed goals
- logged food
- logged workout
- updated wellness check-in
- changed financial categories
- deleted files
- restored deleted files
- exported data
- entered secure vault
- enabled biometric security
- app updates
- AI-generated interventions
- panic mode activations
- shutdown mode activations

Everything important should be trackable.

Activity Item Structure

Every activity item should contain:

Timestamp

Examples:

- Today · 8:41 PM
- Yesterday · 2:12 PM
- Monday · 9:14 AM

Include exact timestamps internally.

Action Type

Examples:

- Created
- Deleted
- Edited
- Restored

- Completed
 - Activated
 - Disabled
 - Uploaded
-

Feature Category

Examples:

- Journal
 - Calendar
 - Protect Mode
 - Wellness
 - Documents
 - Dashboard
 - Finance
 - AI Companion
-

Short Description

Examples:

- "Changed wallpaper to Taupe Air"
 - "Activated Sleep Mode for 1 hour"
 - "Deleted Appointment: Dental Cleaning"
 - "Completed habit: Morning Walk"
-

Undo Option

When supported.

Examples:

- Restore deleted journal entry
 - Re-enable notifications
 - Revert theme changes
 - Restore deleted appointment
-

Details View

Expand to see:

- previous value
 - new value
 - exact time
 - affected categories
 - linked actions
-

Undo System

One of the strongest features.

The app should allow quick reversal of many actions.

Examples:

Undoable Actions

- settings changes
 - deleted journal entries
 - deleted appointments
 - moved widgets
 - muted notifications
 - changed layouts
 - changed themes
 - removed routines
 - deleted tasks
-

Non-Undoable but Logged

Some actions should only appear in history.

Examples:

- AI response generated
- viewed document
- opened app
- entered Protect Mode
- breathing session started
- app searched

Auto Delete & Retention Settings

Users should fully control activity retention.

Retention Options

- Delete daily
- Delete after 30 days
- Delete after 60 days
- Delete after 90 days
- Delete after 1 year
- Never delete

Manual Controls

- Clear activity now
- Delete selected items
- Delete by category
- Delete by date range
- Export activity log

Search & Filtering

The Activity page should feel powerful.

Search Examples

- "Protect Mode"
- "Journal edits"
- "Deleted items"
- "Last week"
- "Finance changes"

Filters

- By category
- By date
- By severity
- By action type

- By emotional state
 - By AI interaction
 - By device
-

Privacy Features

Some activity should be sensitive.

Security Options

- Hide sensitive activity
- Require Face ID/Fingerprint
- Private mode logs
- Hidden categories
- Vault-only history

Examples:

- secure documents
 - emotional check-ins
 - Protect Mode details
 - finance actions
-

Emotional Intelligence Integration

Activity should help users understand patterns.

Examples:

- frequent Protect Mode activations
- repeated Sleep Mode usage
- missed routines during stressful weeks
- emotional trends
- burnout patterns
- productive periods

The app should gently identify trends without sounding clinical.

UI & Visual Design

The Activity tab should feel:

- clean
- premium
- minimal
- organized
- elegant
- calm

NOT like developer logs.

It should resemble:

- Apple Activity History
 - Luxury OS timeline
 - Calm productivity dashboard
-

Future Features

Timeline View

Visual timeline of:

- moods
 - actions
 - routines
 - milestones
 - panic mode events
-

AI Summaries

Examples:

- "You were most productive Tuesday mornings."
 - "Stress levels increased during finance tasks."
 - "You tend to enter Sleep Mode after 10 PM."
-

Export System

Users should be able to export:

- all activity
 - selected categories
 - date ranges
 - PDF summaries
 - CSV logs
-

System Philosophy

The Activity System should make the user feel:

- safe
- aware
- in control
- organized
- understood
- able to recover mistakes

The goal is not surveillance. The goal is clarity, accountability, and peace of mind.

Final Vision

Ciantis should feel like a true Life Operating System.

The Activity tab becomes:

- memory
- accountability
- recovery system
- behavior tracker
- emotional pattern tracker
- undo system
- timeline of life organization

Everything important is recorded. Everything feels recoverable. Everything feels intentional.
