

Ciantis — Notification System Reference

The notification icon in Ciantis is not just a bell. It is the app's central nervous system.

Because Ciantis is emotionally intelligent and space-based, notifications become far deeper than traditional apps.

The system should feel:

- elegant
- emotionally aware
- calm when needed
- urgent when necessary
- luxurious
- intentional

NOT:

- spammy
 - chaotic
 - overwhelming
 - generic
-

WHAT THE NOTIFICATION ICON DOES

The notification system should:

- show alerts
- show emotional interventions
- show AI summaries
- show space-specific updates
- show silent/background warnings
- show Protect Mode activity
- show urgent life reminders
- show system intelligence

Notifications should feel like controlled awareness instead of pressure.

NOTIFICATION CENTER FEATURES

1. Smart Priority System

Notifications are categorized by urgency.

Critical

Examples:

- bill due today
 - appointment in 15 minutes
 - panic mode activation
 - medication reminder
 - school deadline
-

Important

Examples:

- unfinished routine
 - habit reminders
 - low water intake
 - unread journal prompts
-

Soft

Examples:

- affirmations
 - inspiration
 - devotional reminders
 - wellness suggestions
 - weather updates
-

2. Emotional Intelligence Notifications

The system adapts notifications based on:

- stress level
- anxiety level

- burnout detection
- sleep quality
- workload
- avoidance behavior
- emotional state

Examples: If stress is high:

- reduce notification frequency
- soften tones
- pause nonessential reminders
- simplify wording
- suggest Protect Mode
- reduce stimulation

The app should respond to the user's nervous system.

3. Panic Mode Countdown Banner

One of the core premium features.

Like Samsung alarm notifications, a banner slides down from the top of the screen.

Example:

"Protect Mode will activate in 1 minute."

Buttons:

- Extend
- Start Now
- Dismiss
- Until Tomorrow

Users can customize:

- countdown length
- extend increments
- automatic shutdown behavior
- urgency levels

The banner should feel:

- important
- cinematic
- emotionally intelligent

- premium

NOT aggressive or stressful.

4. Sleep Mode Notifications

When Sleep Mode activates: most notifications disappear.

Allowed notifications:

- emergency contacts
- alarms
- health tracking
- pedometer
- essential reminders
- grounding prompts

The UI becomes:

- dim
- minimal
- black or taupe
- low stimulation
- reduced motion

The phone should feel quieter.

5. Space-Specific Notifications

Each Ciantis space should have independent notification controls.

Examples:

Health Space

- hydration reminders
- medication reminders
- wellness prompts

School Space

- assignment deadlines
- exam reminders

Business Space

- client reminders
- inventory alerts
- booking notifications

Spiritual Space

- scripture reminders
- devotional prompts

Users can customize each category independently.

6. AI Summary Notifications

Instead of flooding the user with separate alerts, AI combines information intelligently.

Example:

Instead of:

- 9 different notifications

The user receives:

“You have: • 2 appointments • 1 overdue task • low water intake • a journal reminder”

One elegant summary card.

The goal is reduced overwhelm.

7. Dynamic Notification Tone

The app changes how it speaks depending on the user’s state.

Examples:

Calm Mode

“You still have time. Let’s handle this step by step.”

Protective Mode

"Hey. Your nervous system looks overloaded."

Firm Mode

"Avoiding this will make tomorrow harder."

Spiritual Mode

Scripture-based encouragement.

The tone system should feel:

- human
- grounded
- emotionally intelligent
- calm
- supportive

NOT robotic or fake.

8. Notification Styling

The visual design must feel premium.

Examples:

- frosted glass
- cinematic blur
- soft shadows
- taupe/champagne themes
- elegant motion
- subtle haptics
- breathing animations

Avoid:

- bright spammy alerts
- cartoon colors
- clutter
- cheap Android aesthetics

9. Notification History

Connected directly to the Activity System.

Users can:

- search notifications
- restore dismissed alerts
- pin important notifications
- filter by category
- export logs
- view timestamps

Everything should be searchable and organized.

10. Interactive Notifications

Notifications should behave like mini apps.

Examples:

- complete task
- snooze reminder
- extend panic mode
- activate Sleep Mode
- log water intake
- reply to journal prompt
- reschedule appointment
- start grounding exercise

Without fully opening the app.

LIMITATIONS

Android Limitations

Some system-wide features require:

- notification access permissions
- accessibility permissions
- launcher integration

- overlay permissions

Android still allows far more customization than iPhone.

iPhone Limitations

iOS is much stricter.

Apple limits:

- notification manipulation
- system overlays
- lock screen behavior
- background control
- launcher replacements

Android will always provide deeper integration for Ciantis.

Too Many Notifications = Failure

One of the biggest risks is overwhelm.

The AI must learn:

- when NOT to notify
- when silence is healthier
- when to combine alerts
- when intervention is necessary

Balance is critical.

Emotional AI Must Be Careful

Protect Mode notifications should feel:

- grounding
- urgent
- intelligent
- protective

NOT:

- manipulative

- guilt-inducing
- emotionally triggering

The goal is interruption without emotional punishment.

CORE PHILOSOPHY

Most apps ask: "How do we get the user's attention?"

Ciantis asks: "What does the user's nervous system need right now?"

That difference defines the entire notification system.

FINAL VISION

The Ciantis Notification System should feel like:

- a luxury operating system
- an emotionally intelligent assistant
- a nervous-system-aware environment
- a calm but powerful life management system

Notifications should not create stress. They should reduce it.
